

MILOLOGIC

Trainee Training Program — Terms & Conditions & Code of Conduct

Program: Technical Training & Internship Preparation Program

Initial Tracks: Frontend Development & Backend Development

Future Tracks: DevOps, Cloud, Infrastructure, QA, Security, and other technical areas as determined by MiloLogic

Program Type: Training / Internship Preparation

Compensation: Unpaid — No monetary transaction or remuneration is associated with participation

1. Purpose of the Program

The MiloLogic Trainee Training Program is designed to provide practical, project-oriented technical training and prepare trainees for potential professional software development work.

The program focuses on developing the trainee's ability to:

- Understand software development concepts and practices.
- Research technical problems independently.
- Implement solutions rather than merely copy existing solutions.
- Understand the code and systems they work with.
- Explain technical decisions and implementations clearly.
- Work with modern development tools and documentation.
- Collaborate with other developers.
- Follow professional software development practices.
- Take ownership and responsibility for assigned work.

The initial training focus will be **Frontend Development and Backend Development**. Additional areas such as DevOps, Cloud, Infrastructure, Testing, Security, and related technologies may be introduced later based on the requirements of the training program.

2. Nature of the Training

This program is a **training and internship-preparation program** and is not a paid employment arrangement.

Participation in the program does not automatically constitute employment with MiloLogic.

Unless separately agreed through an official employment or internship agreement:

- No salary will be provided.
- No stipend will be provided.
- No payment will be made for completed assignments.

- No monetary transaction is required from the trainee for participation.
- Participation does not guarantee future employment.
- Completion of the training does not guarantee a job offer.

Any future employment or internship opportunity will be subject to a separate evaluation and agreement.

3. No Unauthorized Use of AI for Assigned Work

Trainees are expected to develop their own technical ability and problem-solving skills. **AI tools must not be used to complete assigned work unless the trainer explicitly permits their use.**

This includes, but is not limited to:

- ChatGPT
- Claude
- Gemini
- GitHub Copilot
- Cursor AI
- Code generation tools
- AI-powered coding assistants
- AI-generated solutions copied into assignments
- AI-generated explanations submitted as the trainee's own understanding

The restriction applies particularly to:

- Assignment solutions
- Coding tasks
- Debugging tasks
- Technical assessments
- Research assignments
- Documentation assigned as individual work
- Project implementation

The purpose of this rule is not to prevent trainees from learning about AI. Rather, it is intended to ensure that trainees first develop the ability to **research, reason, implement, debug, and explain** technical solutions independently.

If AI use is specifically permitted for a particular task, the trainer may define the permitted scope.

4. Independent Research Requirement

Trainees are expected to perform their own technical research.

When researching a technology, problem, implementation, or solution, trainees should use reliable technical sources.

Examples include:

Official Documentation

- Node.js documentation
- React documentation
- Vue documentation
- Angular documentation
- NestJS documentation
- Express documentation
- PostgreSQL documentation
- Docker documentation
- Git documentation
- Nginx documentation
- Redis documentation
- AWS documentation
- Microsoft documentation
- Other official documentation relevant to the technology being used

Technical Communities

Trainees may also use reputable technical communities and discussion platforms such as:

- Stack Overflow
- Reddit technical communities •
- GitHub issues and discussions •
- Developer forums
- Engineering blogs
- Technical articles

However, community answers must not automatically be treated as authoritative.

Trainees are expected to verify important information against official documentation or other reliable sources where appropriate.

5. Source Attribution

When research materially contributes to a project, assignment, technical decision, or documentation, trainees may be required to provide the relevant sources.

For example:

Problem: Docker container was unable to connect to PostgreSQL.

Research: - Docker Networking Documentation - PostgreSQL Documentation - Relevant Stack Overflow discussion

Trainees should be able to explain:

1. What problem they were solving.
2. What they researched.
3. Which sources they consulted.
4. What solution they selected.
5. Why that solution was selected.
6. What alternatives were considered, where relevant.
7. How the solution was implemented.

Simply providing a link without understanding the material does not satisfy the research requirement.

6. Understanding Over Copying

A fundamental requirement of this program is:

If you implement it, you should understand it.

Trainees may encounter existing code, examples, documentation, Stack Overflow answers, GitHub repositories, tutorials, and other learning resources.

Using such resources for learning is permitted unless specifically restricted for a particular task.

However, trainees must not blindly copy implementations.

A trainee may be asked at any time to:

- Explain a section of their code.
- Modify their implementation.
- Reimplement part of the solution.
- Explain why a particular approach was selected.
- Identify potential problems with their implementation.
- Debug their own code.
- Explain the flow of data.
- Explain dependencies and libraries used.
- Explain API requests and responses.
- Explain database interactions.
- Explain authentication or authorization mechanisms.
- Explain the purpose of configuration files.
- Explain how their code behaves in different scenarios.

Inability to explain a substantial portion of work submitted by the trainee may be treated as evidence that the trainee does not sufficiently understand the submitted work.

7. Explain What You Build

Trainees must develop the ability not only to build software but also to **communicate technical concepts**.

A trainee may be asked to explain a project to:

- A trainer
- Another trainee
- A developer
- A technical reviewer
- A future team member

The trainee should be able to explain the system at an appropriate level of detail.

For example, a Backend trainee should eventually be able to explain:

- API architecture
- Request/response lifecycle
- Controllers and services
- Database interaction
- Authentication
- Authorization
- Validation
- Error handling
- Middleware
- Dependency management
- Environment configuration
- Logging
- Testing
- API security
- Deployment considerations

A Frontend trainee should be able to explain:

- Component architecture
- State management
- Routing
- API integration
- Form handling
- Validation
- Authentication flows
- Error handling
- Browser behaviour
- Network requests
- Build systems
- Environment configuration
- Performance considerations
- Responsive design
- Accessibility where applicable

The exact topics may vary depending on the training track.

8. Assigned Work

Trainees may receive:

- Research tasks
- Coding assignments
- Debugging exercises
- Feature development
- Documentation tasks
- Code-review exercises
- Technical presentations
- Individual assignments
- Group assignments
- Project work
- Practical assessments

Assignments must be completed within the timeframe specified by the trainer.

If a trainee is unable to complete an assignment on time, they should communicate the issue before the deadline whenever reasonably possible.

Silently abandoning assigned work is not considered acceptable professional behaviour.

9. No False Claims

Trainees must not falsely claim:

- That they implemented something they did not implement.
- That they researched something they did not research.
- That they understand something they do not understand.
- That they completed an assignment they did not complete.
- That a source supports a claim when it does not.
- That they performed testing that they did not perform.

It is acceptable to say:

"I don't know."

It is acceptable to say:

"I researched this but I still don't fully understand it."

It is acceptable to say:

"I attempted this approach and it did not work."

Honest communication is preferred over presenting incorrect information with confidence.

10. Plagiarism and Unauthorized Copying

Trainees must not submit another person's work as their own.

This includes copying:

- Another trainee's assignment.
- Another trainee's code.
- Complete solutions from repositories.
- Paid courses or assignments.
- Technical assessments.
- Proprietary company code.
- Internal company material.
- Any other work represented as the trainee's original work.

Learning from public resources is allowed where appropriate, but direct copying of substantial work without understanding or attribution may be treated as a violation.

11. Group Work

When working in a group, each trainee is expected to understand their own contribution.

A trainee must not rely entirely on another trainee to complete their assigned portion of the work.

The trainer may individually question group members about the project.

Each trainee should be able to explain:

- Their contribution.
- The relevant implementation.
- The decisions they made.
- The problems they encountered.
- How they solved those problems.

Group completion does not eliminate individual accountability.

12. Code Quality and Professional Practices

Trainees are expected to progressively follow professional development practices appropriate to their level.

This may include:

- Meaningful variable and function names.
- Appropriate project structure.
- Consistent formatting.
- Reasonable error handling.
- Proper Git usage.
- Meaningful commits.
- Environment-variable management.
- Avoiding unnecessary hard-coded credentials.
- Appropriate dependency management.
- Basic security awareness.
- Documentation where required.
- Testing where applicable.
- Clean and maintainable code.

The standard expected will increase as the trainee progresses through the program.

13. Git and Version Control

Where Git is used, trainees are expected to follow the Git workflow defined by the training project.

This may include:

- Creating appropriate branches.
- Making meaningful commits.
- Writing useful commit messages.
- Avoiding unnecessary generated files.
- Avoiding committed secrets.
- Reviewing changes before submission.
- Resolving merge conflicts appropriately.
- Maintaining a clean repository.

Trainees may be required to explain their Git history and changes.

14. Security and Confidentiality

Trainees must treat any non-public information provided during the training as confidential.

This includes, where applicable:

- Source code
- Credentials
- API keys
- Environment variables
- Database credentials
- Internal documentation

- Client information
- Infrastructure details
- Server information
- Internal architecture
- Private repositories
- Internal communications

Trainees must not publish, share, copy, or distribute such information without authorization.

Credentials and secrets must never be intentionally committed to public repositories.

Any accidental exposure of credentials or sensitive information must be reported immediately.

15. Professional Conduct

Trainees are expected to maintain professional behaviour throughout the training.

The following behaviour is not acceptable:

- Harassment
- Threatening behaviour
- Discrimination
- Abusive communication
- Intentionally disrupting sessions
- Repeatedly disrespecting trainers or other trainees
- Deliberately damaging project infrastructure
- Unauthorized access to systems
- Unauthorized modification of other trainees' work
- Deliberate misuse of company resources
- Sharing confidential information
- Academic dishonesty
- Repeated refusal to follow reasonable training instructions

Constructive disagreement and technical debate are encouraged.

Personal attacks are not.

16. Attendance and Participation

Trainees are expected to attend scheduled training sessions and actively participate.

Active participation may include:

- Asking questions.
- Completing assignments.
- Participating in discussions.
- Performing research.

- Demonstrating completed work.
- Explaining technical decisions.
- Participating in code reviews.
- Working on assigned projects.

Repeated absence, inactivity, or failure to participate may affect the trainee's eligibility for completion certification.

17. Questions Are Encouraged

Trainees are encouraged to ask questions.

However, before asking a question about a technical problem, trainees may be expected to perform reasonable initial investigation.

A useful technical question should ideally include:

- What was attempted.
- What was expected.
- What actually happened.
- Relevant error messages.
- Relevant documentation researched.
- Relevant code or configuration.
- What remains unclear.

For example:

"I tried X based on the Node.js documentation. I expected Y, but received Z. I also tried A, but the problem remains. I believe the issue may be related to B because..."

This is preferred over:

"It doesn't work. Fix it."

18. Trainer Evaluation

The trainer may evaluate trainees based on:

- Technical understanding.
- Problem-solving ability.
- Research ability.
- Quality of implementation.
- Communication.
- Ability to explain work.
- Consistency.
- Attendance.
- Assignment completion.

- Teamwork.
- Professional conduct.
- Ability to learn from feedback.
- Independence.

Evaluation may include practical tests, technical discussions, code reviews, presentations, and project demonstrations.

19. Right to Remove a Trainee

MiloLogic reserves the right to remove a trainee from the training program at any time if a significant violation of these rules or other reasonable training requirements is identified.

Examples include, but are not limited to:

- Unauthorized AI use for restricted assignments.
- Plagiarism.
- Submitting work the trainee cannot explain.
- Falsifying research or results.
- Unauthorized access to systems.
- Deliberate security violations.
- Sharing confidential information.
- Harassment or serious misconduct.
- Repeated failure to follow training requirements.
- Deliberate disruption of the training environment.

Depending on the nature and severity of the violation, removal may occur immediately without additional opportunity to continue the session.

20. Certification

A training completion certificate may be provided to trainees who successfully complete the applicable training requirements.

Certification is **not automatic**.

A trainee may be denied certification if they:

- Are removed from the program for a violation.
- Fail to complete required assignments.
- Demonstrate insufficient participation.
- Fail required evaluations.
- Repeatedly violate training requirements.
- Provide misleading or fraudulent work.
- Do not meet the minimum completion criteria established for the program.

A certificate represents successful completion of the training requirements. It does not constitute a guarantee of employment or professional competency in every technology covered by the program.

21. No Monetary Transaction

This training program is conducted without monetary compensation or payment between the trainee and MiloLogic, unless a separate written agreement states otherwise.

The trainee is not required to pay MiloLogic for participation in the training program.

Likewise, MiloLogic is not required to provide salary, stipend, or other monetary compensation for participation in this training program unless separately agreed in writing.

Any future employment or paid internship arrangement will be handled separately.

22. Transition to Employment or Internship

Successful participation in the training program may allow trainees to be considered for future opportunities with MiloLogic or its projects.

However:

Training completion does not guarantee employment.

Any employment or paid internship opportunity will depend on factors including:

- Technical performance.
- Project requirements.
- Available positions.
- Interview or evaluation results.
- Professional conduct.
- Business requirements.
- Overall suitability for the relevant role.

If selected, the trainee will receive a separate employment or internship agreement containing the applicable terms.

23. Training Technology Scope

The technology covered by the program may change according to project requirements and industry needs.

Initial Focus

Frontend Development

Potential technologies include:

- HTML
- CSS
- JavaScript
- TypeScript
- React / other frontend frameworks
- REST API integration
- State management
- Git
- Testing
- Build tooling

Backend Development

Potential technologies include:

- Node.js
- TypeScript
- Express
- NestJS
- REST APIs
- PostgreSQL
- Redis
- Authentication and authorization
- API validation
- Testing
- Git
- Docker

Future Areas

Depending on the training program and project requirements, additional areas may include:

- Docker
- Linux
- CI/CD
- GitLab CI/CD
- Cloud platforms
- AWS
- DigitalOcean
- Infrastructure
- Nginx
- Monitoring
- Security
- DevOps
- Database administration

- Testing and QA
- System design

The technologies listed above are examples and may be changed or expanded by MiloLogic.

24. Learning Philosophy

The program follows a practical learning philosophy:

Research → Understand → Implement → Test → Explain → Improve

Trainees are expected to progressively move from guided learning toward independent problem solving.

The objective is not simply to produce working code.

The objective is to develop developers who can:

Understand what they are doing, explain why they are doing it, and independently solve problems when something goes wrong.

25. Acceptance of Terms

By participating in the MiloLogic Trainee Training Program, the trainee acknowledges that they have read and understood these Terms & Conditions and agree to follow the rules and expectations described above.

The trainee understands that:

- The program is primarily for training and internship preparation.
 - The program is unpaid unless separately agreed in writing.
 - AI may not be used for restricted assignments without explicit permission.
 - Independent research is expected.
 - Sources may be required for technical research.
 - Submitted work must be understood by the trainee.
 - Professional conduct is required.
 - Violations may result in removal from the program.
 - Removal for a violation may result in no training completion certificate being issued.
 - Training completion does not guarantee employment.
